```
user = input("Enter your name : ").lower()
count = len(user)
s = "@" + user
print(f"{s}{count}")
```

```
Enter your name : sof
@sof3
```

ASSIGNMENT

1. Write a program to find the length of a string entered by the user.

```
s = input("Enter a string : ")
print(f"Length of string : {len(s)}")
```

```
Enter a string : aaa
Length of string : 3
```

2. Write a program to take a number from the user and display its data type.

```
num = input("Enter a number: ")

print(f"The data type of the input is: {type(num)}")
```

3. Write a program to take two numbers from the user and print their sum using type conversion.

```
num1 = int(input("Enter 1st number: "))
num2 = int(input("Enter 2nd number: "))
print(f"The data type of the sum is: {num1+num2}")
```

```
Enter 1st number: 12
Enter 2nd number: 12
The data type of the sum is: 24
```

4. Write a program to find the maximum of two numbers using a built-in function.

```
num1 = int(input("Enter 1st number: "))
num2 = int(input("Enter 2nd number: "))
print(f"Max number: {max(num1, num2)}")
```

```
Enter 1st number: 23
Enter 2nd number: 45
Max number: 45
```

5. Write a program to take a string input and display it in uppercase.

```
s = input("Enter a string : ")
print(s.upper())
```

```
Enter a string : aaa
AAA
```

6. Write a program to display the first and last character of a string.

```
s = input("Enter a string : ")
print(f"first character : {s[0]}")
print(f"last character : {s[-1]}")
```

```
Enter a string : abcd
first character : a
last character : d
```

7. Write a program to check whether a string is empty or not.

```
s = input("Enter a string : ")
if not s:
  print("String is Empty!")
else:
  print("String is not empty!")
```

```
Enter a string : ssss
String is not empty!
```

8. Write a program to count the number of characters in a string without using len().

```
s = input("Enter a string : ")
count = 0
for c in s:
  count += 1
print("Number of characters in string : ", count)
```

```
Enter a string : aaaaa
Number of characters in string :  5
```

9. Write a program to reverse a string.

```
s = input("Enter a string : ")
print("Reversed string : ", s[::-1])
```

```
Enter a string : abcd
Reversed string :  dcba
```

10. Write a program to check whether a given string is a palindrome.

```
s = input("Enter a string : ")
sr = s[::-1]
if s == sr:
  print("String is a palindrome!")
else:
  print("String is not a Palindrome!")
```

```
Enter a string : level
String is a palindrome!
```

11. Write a program to convert a string into lowercase and uppercase.

```
s = input("Enter a string : ")
print("String in Uppercase : ", s.upper())
print("String in lowercase : ", s.lower())
```

```
Enter a string : Abasb
String in Uppercase :  ABASB
String in lowercase :  abasb
```

12. Write a program to remove extra spaces from the beginning and end of a string.

```
s = input("Enter a string : ")
print(f"Before strip : '{s}'")
print("After strip : ", s.strip())
```

```
Enter a string :            helloo
Before strip : '           helloo          '
After strip :  helloo
```

13. Write a program to replace a word in a string with another word.

```
s = input("Enter a string : ")
print("Replace world with admin : ", s.replace("world", "Admin"))
```

```
Enter a string : Hello world
Replace world with admin :  Hello Admin
```

14. Write a program to find the position of a word in a sentence.

```
s = input("Enter a string : ")
find = input("Enter word to be found : ")
pos = s.index(find)
print("Position of a word : ", pos)
```

```
Enter a string : Hello Admin! Good morning
Enter word to be found : Good
Position of a word :  13
```

15. Write a program to split a sentence into words.

```
s = input("Enter a string : ")
print(s.split())
```

```
Enter a string : hello world good morning
['hello', 'world', 'good', 'morning']
```

16. Write a program to take a user name, remove spaces, and display the total number of characters.

```
s = input("Enter a string : ")
s2 = s.replace(" ","")
print("Number of characters after removing spaces : ", len(s2))
```

```
Enter a string : hello world
Number of characters after removing spaces :  10
```

17. Write a program to check whether an email ID contains the symbol @.

```
s = input("Enter an email ID : ")
if "@" in s:
  print("Email Id has @")
else:
  print("Email Id does not have @")
```

```
Enter an email ID : rohn@233
Email Id has @
```

18. Write a program to count the number of vowels in a string.

```
s = input("Enter a string : ")
vowels = "aeiou"
count = 0
for v in vowels:
  if v in s:
    count += 1
print("Number of vowels : ", count)
```

```
Enter a string : hello
Number of vowels :  2
```

19. Write a program to take a sentence and count how many words it contains.

```
s = input("Enter a sentence : ")
words = s.split()
print("Number of words : ", len(words))
```

```
Enter a sentence : hello world
Number of words :  2
```

20. Write a program to take a string from the user and display each character one by one using a loop.

```
s = input("Enter a string : ")
for c in s:
  print(c)
```

```
Enter a string : hello world
h
e
l
l
o

w
o
r
l
d
```
