NumPy

1. Write a Python program to create a NumPy array with five integers and display it.

```
import numpy as np

arr = np.array([1,2,3,4,5])
print(arr)
```

```
[1 2 3 4 5]
```

2. Write a program to find the data type of a NumPy array.

```
import numpy as np
arr = np.arange(1,5)
print(arr.dtype)
```

```
int64
```

3. Write a program to access the first and last element of a NumPy array.

```
import numpy as np

arr = np.array([1,2,3,4,5])
print(arr[0], arr[-1])
```

```
1 5
```

4. Write a program to slice a NumPy array and print elements from index 1 to 3.

```
import numpy as np

arr = np.array([1,2,3,4,5])
print(arr[1:4])
```

```
[2 3 4]
```

5. Write a program to display the first three elements of a NumPy array using slicing.

```
import numpy as np

arr = np.array([1,2,3,4,5])
print(arr[:3])
```

```
[1 2 3]
```

6. Write a program to extract the last two elements of a NumPy array using slicing.

```
import numpy as np

arr = np.array([1,2,3,4,5])
print(arr[-2:])
```

```
[4 5]
```
